

Slang and the 3D Shading Landscape

Shannon Woods, NVIDIA

KHRON OS

The Shading Language Landscape Today

- Shader codebases have become incredibly large & complex
- Developers need to deploy to many platforms
- Shader combinatorial explosion
- New graphics techniques & neural graphics discontinuity
- GLSL no longer innovating new language features

Open-Source, Cross-Platform Compiler

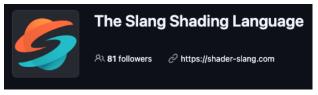

Slang + Khronos = Developers Win

- Shading language diversity means more competition & innovation
- No single company controls the language, so it can evolve as developers need

For developers, by developers

- Community structure built from OSS best practices
- Any company or individual is welcome to become a contributor, not just Khronos members
- Decision-making and development in the open you can join technical conversations today on Discord, or propose features directly to the repository.
- Slang developers make the decisions about what goes into the language, and you can become one

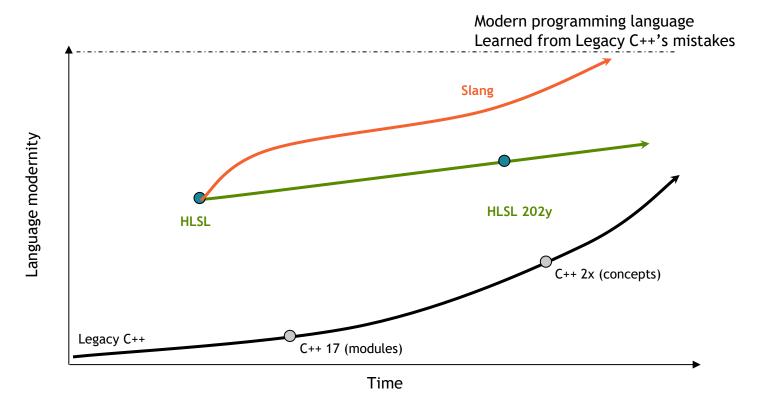

K H RON CON

Why Another Shading Language?

	GLSL	MSL	WGSL	HLSL	5 Slang
Actively Evolving	NO	YES	YES	YES	YES
Modular Code Management	NO	NO	NO	NO	YES
Converging with C++	NO	YES	NO	YES	NO*
Auto-diff / Neural Shading	NO	NO	NO	NO	YES
Diverse Backend Targets	NO	NO	NO	DXIL and SPIR-V	YES
Open-Source Compiler(s)	YES	NO	YES	YES	YES
Open Governance	YES	NO	YES	NO	YES

^{*} Slang and HLSL are taking complementary evolutionary paths
HLSL will remain and evolve as a critically important shading language for many developers
Language diversity and choice is good for the graphics ecosystem!

Language Evolution

What makes Slang special?

- Cross-compilation in Slang is easy and ergonomic
 - a seamless way integrated in one place
 - tooling just works
- Automatic differentiation
 - unique among shading languages
 - starting to show up as a necessity
 - for most Al graphics work
- Proper solve for modularity, permutations, compile time explosion, and "string pasting"
 - Drawing on advances from the broader language space, Slang addresses these issues with modules, generics, and interfaces

K H RON OS

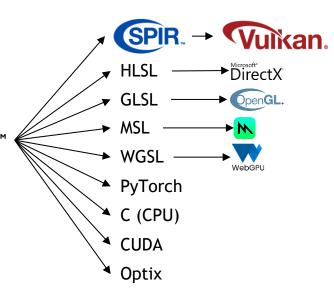

Seamless Cross-Compilation in Slang

 No need to chain together multiple libraries

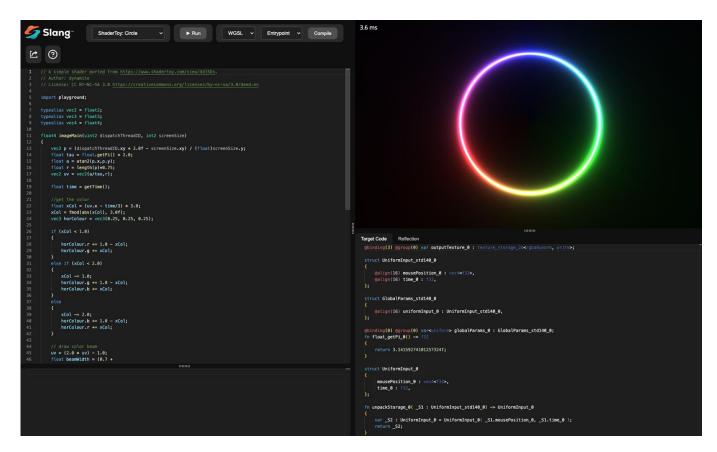

Tooling just works

Produces human-readable code

New in Slang: WGSL Support for WebGPU

New in Slang: Metal Support

- Vertex, fragment, compute, mesh, and amplification shaders supported
 - No ray tracing yet
- Automatic transformations performed for Metal legalization documented <u>here</u>
 - Enables Slang to support some functionality even though a Metal equivalent doesn't exist. E.g. combined samplers, pointer to vector element
- Debug & tooling compatibility w/ #line directives

```
#line 11 "/user.slang"
float4 imageMain 0(uint2 dispatchThreadID 0, int2 screenSize 0, KernelContext 0 thread* kernelContext 1)
   float2 p_0 = (float2(dispatchThreadID_0.xy) * 2.0 - float2(screenSize_0.xy)) / float(screenSize_0.y);
   float tau_0 = float_getPi_0() * 2.0;
   float _S1 = atan2(p_0.x, p_0.y) / tau_0;
#line 17
   float2 uv_0 = float2(_S1, length(p_0) * 0.75);
#line 17
   float _S2 = getTime_0(kernelContext_1);
#line 23
   float S3 = abs(( S1 - S2 / 3.0) * 3.0);
#line 23
   float xCol_0 = ((((_S3) < 0.0) ? -fmod(-(_S3),abs((3.0))) : fmod((_S3),abs((3.0)))));
   thread float3 horColour_0 = float3(0.25, 0.25, 0.25);
   if(xCol 0 < 1.0)
       horColour_0.x = horColour_0.x + (1.0 - xCol_0);
       horColour_0.y = horColour_0.y + xCol_0;
#line 26
       if(xCol 0 < 2.0)
           float xCol_1 = xCol_0 - 1.0;
           horColour 0.y = horColour 0.y + (1.0 - xCol 1);
           horColour 0.z = horColour 0.z + xCol 1;
```

Slang Tooling

You can already use Slang with existing toolchains

- Step-through debugging in Renderdoc
- Shader inspection in Nsight
- Slang in Vulkan SDK 1.3.296.0 and above

Amazing autocomplete support

- Extensions for Visual Studio & VSCode provide IntelliSense support
- Language server module available for integration into other IDEs
- No other shading language offers something this cool

Step-through debugging in RenderDoc

IntelliSense / Language Server support in action

Easily write & maintain differentiable code

- Differentiable functions power gradient descent solution approaches
 - Slang brings automatic differentiation to languages optimized for GPU usage
 - Developers can optionally provide custom derivatives for just the portions of a shader where it's necessary - flexibility & control
 - Autodiff support includes arbitrary control flow & dynamic dispatch

```
interface IBRDF : IDifferentiable
{
    [Differentiable] float3 eval(float3 L, float3 V, float3 N);
}

struct GGXBRDF : IBRDF
{
    float3 baseColor;
    float roughness;
    float metallic;
    float specular;

    [Differentiable] float3 eval(float3 L, float3 V, float3 N)
    {
        float NdotL = dot(N, L);
        float NdotV = dot(N, V);
        if (NdotL < 0 | | NdotV < 0)</pre>
```

```
fwd_diff(eval)(dpL, dpV, dpN);
```

Use Case: Gaussian Splatting

- Slang implementation of the rasterizer from 3D Gaussian Splatting for Real-Time Rendering of Radiance Fields
 - Kernel performance equivalent to handwritten CUDA

Slang.D Gaussian Splatting Rasterizer

This repository contains a Slang.D implementation of the CUDA accelerated rasterizer that is described in the 3D Gaussian Splatting for Real-Time Rendering of Radiance Fields. We provide only the rasterizer and API bindings to the most popular implementations of the complete 3D Gaussian Splatting implementations:

- 1. The original inria code-base and
- gsplat from nerf-studio.

But why Slang.D?

Slang.D is a unified platform for real-time, inverse and differentiable rendering. Slang serves as an open-source language that allows developers to maintain a single code-base for differentiable high-performance rendering code-bases which can compile down to rendering code for different platforms like D3D, Vulkan, OpenGL, OptiX, CUDA etc.

This allows for a single code-base of the rendering code which has the capability to run at the same time under the differentiable framework of your choice (i.e Pytorch) and under the actual renderer that can be released for production (i.e Vulkan). This makes significant strides toward maintainability and reduces the likelihood of errors.

On top of that and potentially the most important for research is the ability of Slang.D to differentiate automatically through complicated rendering kernels that include arbitrary control flow, user-defined types, dynamic dispatch, generics, and global memory accesses.

Modules + Interfaces + Generics = Faster Compiles

Compilation time

- Within 10% of glslc/dxc compilation times with monolithic code
- Modularized code can reduce time spent in front-end compilation

Modules

Provide separation of compilation and control over visibility

```
material.slang X
module material;
     public struct Material
  4
         public float4 evalBRDF(float3 wi, float3 wo)
  6
            // ...
         internal float4 somePrivateMethod()
  9
 10
 11
            // ...
 12
 13
 14
```

```
scene.slang 1 X
module scene;
       import material;
       struct Scene
           StructuredBuffer<Material> materials;
           void compute(float3 wi, float3 wo)
 10
               float4 result = materials[0].evalBRDF(wi, wo);
 11
               materials[0].somePrivateMethod();
 12
 13
 14
 15
PROBLEMS 1
              OUTPUT
                      DEBUG CONSOLE
                                     TERMINAL
                                              PORTS

✓ ⑤ scene.slang 1

    'somePrivateMethod' is not accessible from the current context. (30600) [Ln 12, Col 22]
```

Generics & Interfaces

```
testslang 2 •

testslang > © computeLighting

interface IMaterial

{
3  | float4 evalBRDF(float3 wi, float3 wo);

4  }

6  float4 computeLighting<M:IMaterial>(M material, float3 lightPos)

7  {
8  }
9 }

10
```

Generics improve code maintainability

Allows Intellisense to provide accurate assistance

Faster front-end compilation time from reusing type checking results

Interfaces make requirements explicit

Similar to Rust traits, Swift protocols, Haskell typeclasses ...

```
interface IMaterial
{
    associatedtype BRDF : IBRDF;
    BRDF sampleAt(SurfacePoint p);
}

interface IBRDF
{
    float4 evaluate(float3 lightDir, float3 eyeDir);
}

interface IGeometry { /*...*/ }
interface ILighting { /*...*/ }
```

K H RON COS

Switching to Slang isn't Hard!

- Valve migrated entire Source 2 HLSL codebase
- Slang in use in production
- Minimal changes (~10 lines) needed to compile existing shaders with Slang

AUTODESK

- Slang is used by Aurora path tracing renderer, enables single-source ray tracing codebase
- Ray tracing support just worked!
- Slang shaders are <u>open source</u> & available to check out

- Binary Size: 8mb uncompressed
- Wasm implementation compressed to 5MB
- No LLVM we generate C++
- Includes all backends!
- Runtime performance
- Meet or beat handwritten code
- Even when using advanced features such as generics

Templates port to generics

```
template<typename T> T selectValue(float inVal, T v0, T v1)
{
   if (inVal <= 1.0)
      return v0;
   else
      return v1;
}</pre>
```

```
__generic<typename T> T selectValue(float inVal, T v0, T v1)
{
    if (inVal <= 1.0)
        return v0;
    else
        return v1;
}</pre>
```

Some template code can be ported trivially to generics by replacing "template" with "__generic"

Generics are templates, but better...

```
template<typename T>
int compute(T v)
{
    return v.eval();
}
```

```
interface IEvaluable
{
    int eval();
}
__generic<typename T>
int compute(T v) where T:IEvaluable
{
    return v.eval();
}
```

This is valid C++ but invalid Slang code.

The compiler cannot prove that T has the eval method.

The solve is telling Slang your type constraints. This easily ifdefs:

```
#ifdef __slang
#    define WHERE(x) where x
#    define template __generic
#else
#    define WHERE(x)
#endif
```
